

AgriPura

AgriPura Mould Liquid is a product that can be used for the optimisation of the moisture content of feed. **AgriPura Mould Liquid** attends to an optimal distribution of the process moisture and for optimal pressing features.

Production of feed. During the process of making feed moisture will evaporate out of the feed which is produced. This is a normal reaction during the production of feed due to the heat which is produced during milling and pressing of the raw materials. In a normal production process the quality of the feed will be less, therefore the operator will lower the delivery of the meal to the press. The raw materials will be longer in the press which will increase the quality of the feed. Also the use of energy, for the production, will increase. The end product will have higher dry matter content.

To compensate for the higher dry matter content it's possible to administer process moisture. To be sure that this process moisture will divide properly and to have less negative consequences for the feed,

AgriPura Mould Liquid is available in 1.000 kg IBC

it's good to administer **AgriPura Mould Liquid** to the process moisture.

Tests show that by administering **AgriPura Mould Liquid** to the process moisture the use of energy will decrease with at minimum 10% and production per hour will increase with at least 10%.

Also the quality of the pellet will increase, which shows less wear and fractions of the pellets.

It's important to use the **AgriPura Mould Liquid** together with the process moisture which is administered to the raw materials.
